

Lucas

Oral and verbal dyspraxia

Case from Joan Wendelboe Nielsen, a Danish Temprana Therapist

---

- ▶ At 6 ½ years, Lucas's verbal language ability was graded to only 50% in fluency. This means his verbal communication only consisted of monosyllable words like house, mom, dad, car etc.
- ▶ After 2-3 months of Temprana Reflex Therapy treatment there was a considerable change in Lucas. This was seen physically, psychologically and verbally. He began to pronounce more sounds and more words.

Case from Joan Wendelboe Nielsen, a Danish Temprana Therapist

---

- ▶ After 4-6 months of Temprana Reflex Therapy he could pronounce polysyllable words and construct simple sentences. His pronunciation improved and his verbal language results were graded to 25% in fluency.
- ▶ The following months he progressed profusely. Lucas was now able to complete sentences and his articulation improved.

Case from Joan Wendelboe Nielsen, a Danish Temprana Therapist

---

- ▶ After about 1 year of Temprana Reflex Therapy Lucas's verbal communication skills are graded to 100% in fluency. This of course has had a positive effect on Lucas's social life, as now he is understood. Most of all it has boosted his self-esteem and he no longer is afraid to interact with others and no longer feels socially isolated.
